

UNIT II

DISASTER RISK REDUCTION (DRR)

1	What is disaster management cycle? The disaster management cycle is a framework for managing disasters through four key phases: mitigation (reducing risk), preparedness (planning and training), response (immediate actions during a disaster), and recovery (restoring and rebuilding after a disaster). This cycle aims to minimize the impact of disasters and enhance community resilience.
2	Define disaster risk reduction. Disaster Risk Reduction (DRR) refers to the systematic approach to minimizing the impact of disasters through proactive measures. It involves identifying, assessing, and implementing strategies to reduce vulnerabilities and enhance resilience, aiming to prevent or mitigate the effects of disasters before they occur.
3	What is mitigation? Mitigation in the context of disaster management refers to the measures and strategies implemented to reduce the severity, impact, or likelihood of future disasters. The goal of mitigation is to lessen the damage and improve resilience, thereby making communities better prepared to handle and recover from disasters.
4	Illustrate the goals of preparedness activities. 1. Enhance Readiness: Ensure that individuals, communities, and organizations are equipped and ready to respond effectively to disasters. This includes having emergency plans, supplies, and training in place. 2. Improve Response Efficiency: Streamline response efforts by establishing clear protocols, roles, and communication channels. Preparedness activities aim to reduce confusion and improve coordination during a disaster. 3. Build Resilience: Strengthen the ability of communities and systems to withstand and recover from disasters. This involves training, public education, and creating robust infrastructure. 4. Reduce Vulnerability: Identify and address weaknesses in structures, systems, and practices that could exacerbate the impact of disasters. Preparedness seeks to minimize these vulnerabilities through proactive measures. 5. Facilitate Recovery: Prepare for swift and effective recovery by planning for resource allocation, recovery operations, and support services. This ensures a smoother transition from response to rebuilding.
5	Build the structure of Panchayati Raj System. The Panchayati Raj System in India comprises three tiers: 1. Gram Panchayat: The village-level body, consisting of elected members (Panchs) and headed by a Sarpanch, responsible for local administration. 2. Panchayat Samiti: The block-level body, with elected members from the Gram Panchayats and led by a chairperson, coordinating development activities across multiple villages. 3. Zila Parishad: The district-level body, comprising members elected from the Panchayat Samitis and chaired by a President, overseeing district-wide governance and development.
6	What are the stages in disaster risk reduction? The stages in Disaster Risk Reduction (DRR) are: 1. Risk Assessment: Identifying and analyzing potential hazards, vulnerabilities, and risks to understand the likelihood and impact of disasters.

	2. Risk Management: Implementing strategies and measures to mitigate risks, including planning, preparedness, and strengthening resilience to reduce the potential impact of disasters.
7	What is the roles PRI? 1. Local Governance and Development: Managing local affairs, implementing development projects, and ensuring effective delivery of public services at the village, block, and district levels. 2. Public Participation: Facilitating community involvement in decision-making and addressing local needs, thereby enhancing democratic processes and local accountability.
8	Write down the types of Urban local bodies. 1. Municipal Corporations: Large urban areas or cities with significant populations, responsible for comprehensive municipal functions and services. 2. Municipalities: Smaller urban areas or towns, managing local governance and services for less densely populated areas compared to municipal corporations. 3. Nagar Panchayats: Urban areas transitioning from rural to urban status, handling governance and development in towns undergoing urbanization.
9	What is International Strategy for disaster management? The International Strategy for Disaster Reduction (ISDR) aims to reduce disaster risks globally through: 1. Promoting Resilience: Enhancing the ability of communities and countries to withstand and recover from disasters by implementing risk reduction measures. 2. Coordination and Collaboration: Facilitating international cooperation and sharing of knowledge, strategies, and resources to improve disaster preparedness and response.
10	List the limitations of Indigenous Knowledge. Limitations of Indigenous Knowledge include: 1. Limited Scope: Often specific to local environments and may not be easily applicable to broader or different contexts outside the indigenous community. 2. Documentation Challenges: Indigenous knowledge is frequently transmitted orally and may lack formal documentation, making it vulnerable to loss and harder to integrate with modern systems.
