

UNIT III DISASTER MANAGEMENT

1	Define disaster management. Disaster management is the systematic approach to preparing for, responding to, and recovering from disasters. It involves a range of activities aimed at minimizing the impact of disasters and ensuring the safety and well-being of affected communities.
2	What is mitigation? Mitigation in the context of disaster management refers to the measures and strategies implemented to reduce the severity, impact, or likelihood of future disasters. The goal of mitigation is to lessen the damage and improve resilience, thereby making communities better prepared to handle and recover from disasters.
3	Write the objectives of disaster management. 1. Protect Lives and Health: Ensure the safety and well-being of individuals by providing timely medical care, shelter, and support during and after a disaster. 2. Safeguard Property and Infrastructure: Minimize damage to homes, businesses, and critical infrastructure by implementing protective measures and conducting timely repairs. 3. Reduce Risk and Vulnerability: Identify and address vulnerabilities through risk assessments, mitigation strategies, and planning to lower the likelihood and severity of future disasters. 4. Facilitate Effective Response: Coordinate resources, personnel, and efforts to manage emergency situations efficiently and provide immediate assistance to affected communities. 5. Ensure Rapid Recovery and Rehabilitation: Support communities in returning to normalcy as quickly as possible by addressing both short-term needs and long-term rebuilding efforts.
4	What is post disaster management? Post-disaster management refers to the activities and processes that take place after a disaster has occurred, focusing on the recovery and rehabilitation of affected communities. The primary goal is to restore normalcy and support the long-term recovery of individuals, communities, and infrastructure.
5	What is disaster relief? Disaster relief refers to the immediate assistance provided to individuals and communities affected by a disaster to meet their urgent needs and alleviate suffering. This assistance is typically delivered in the aftermath of a natural or man-made disaster and focuses on addressing the critical requirements for survival and safety.
6	Write short notes on SDMA. The State Disaster Management Authority (SDMA) is a key component of the disaster management framework in India, established under the Disaster Management Act of 2005. It operates at the state

	level and plays a crucial role in coordinating and implementing disaster management activities within a particular state.
7	Write short notes on early warning signals. Early warning signals are critical components of disaster management systems, designed to provide advance notice of impending hazards, allowing individuals, communities, and authorities to take timely and effective actions to reduce risk and mitigate potential impacts.
8	What are the key elements of DRM? 1. Risk Assessment: Identifying hazards, analyzing vulnerabilities, and evaluating overall risk to understand potential impacts and guide planning. 2. Preparedness: Developing plans, conducting training and drills, and raising public awareness to ensure readiness for effective response to disasters. 3. Mitigation: Implementing measures to reduce disaster impacts through risk reduction strategies, infrastructure improvements, and environmental management. 4. Response: Coordinating immediate actions, including emergency response, communication, and provision of essential services, to manage the disaster's impact. 5. Recovery: Addressing short-term needs, rebuilding infrastructure, and supporting economic and social recovery to restore normalcy and resilience.
9	How do compensation and insurance mechanisms support individuals and communities affected by disaster? Compensation and insurance mechanisms support individuals and communities affected by disasters by: 1. Providing Financial Relief: Compensation and insurance offer financial assistance to cover losses such as damaged property, medical expenses, and temporary relocation costs, helping individuals and communities recover more quickly. 2. Facilitating Recovery: These mechanisms help in rebuilding and restoring livelihoods by covering repair costs, supporting businesses, and funding reconstruction efforts, thereby aiding long-term recovery and resilience.
10	What is meant by rehabilitation? Rehabilitation in the context of disaster management refers to the process of restoring and improving the affected areas and communities to a state of normalcy after a disaster.
