

Rapid Rural Appraisal(RRA)

Rapid Rural Appraisal (RRA) in nutrition is a swift, cost-effective, and semi-structured method used by multidisciplinary teams to assess community nutritional status and identify causes of malnutrition.

It utilizes tools like, key informant interviews, seasonal food availability mapping, and transect walks to gather data, enabling quick identification of food security issues.

Key Techniques:

- **Direct Observation:** Assessing household food storage, local markets, and water sources.
- **Key Informant Interviews:** Speaking with local health workers, leaders, or healers about prevalent diseases and diet.

Rapid Rural Appraisal(RRA)

- Seasonal Analysis: Mapping months of food scarcity, high workload, or illness.
- Focus Group Discussions: Gathering community-level insights on feeding practices.
- Seasonal Calendars & Timelines: Mapping food availability, income, and illness patterns throughout the year.
- Transect Walks: Walking through a village to map resources, land use, and sanitation facilities
